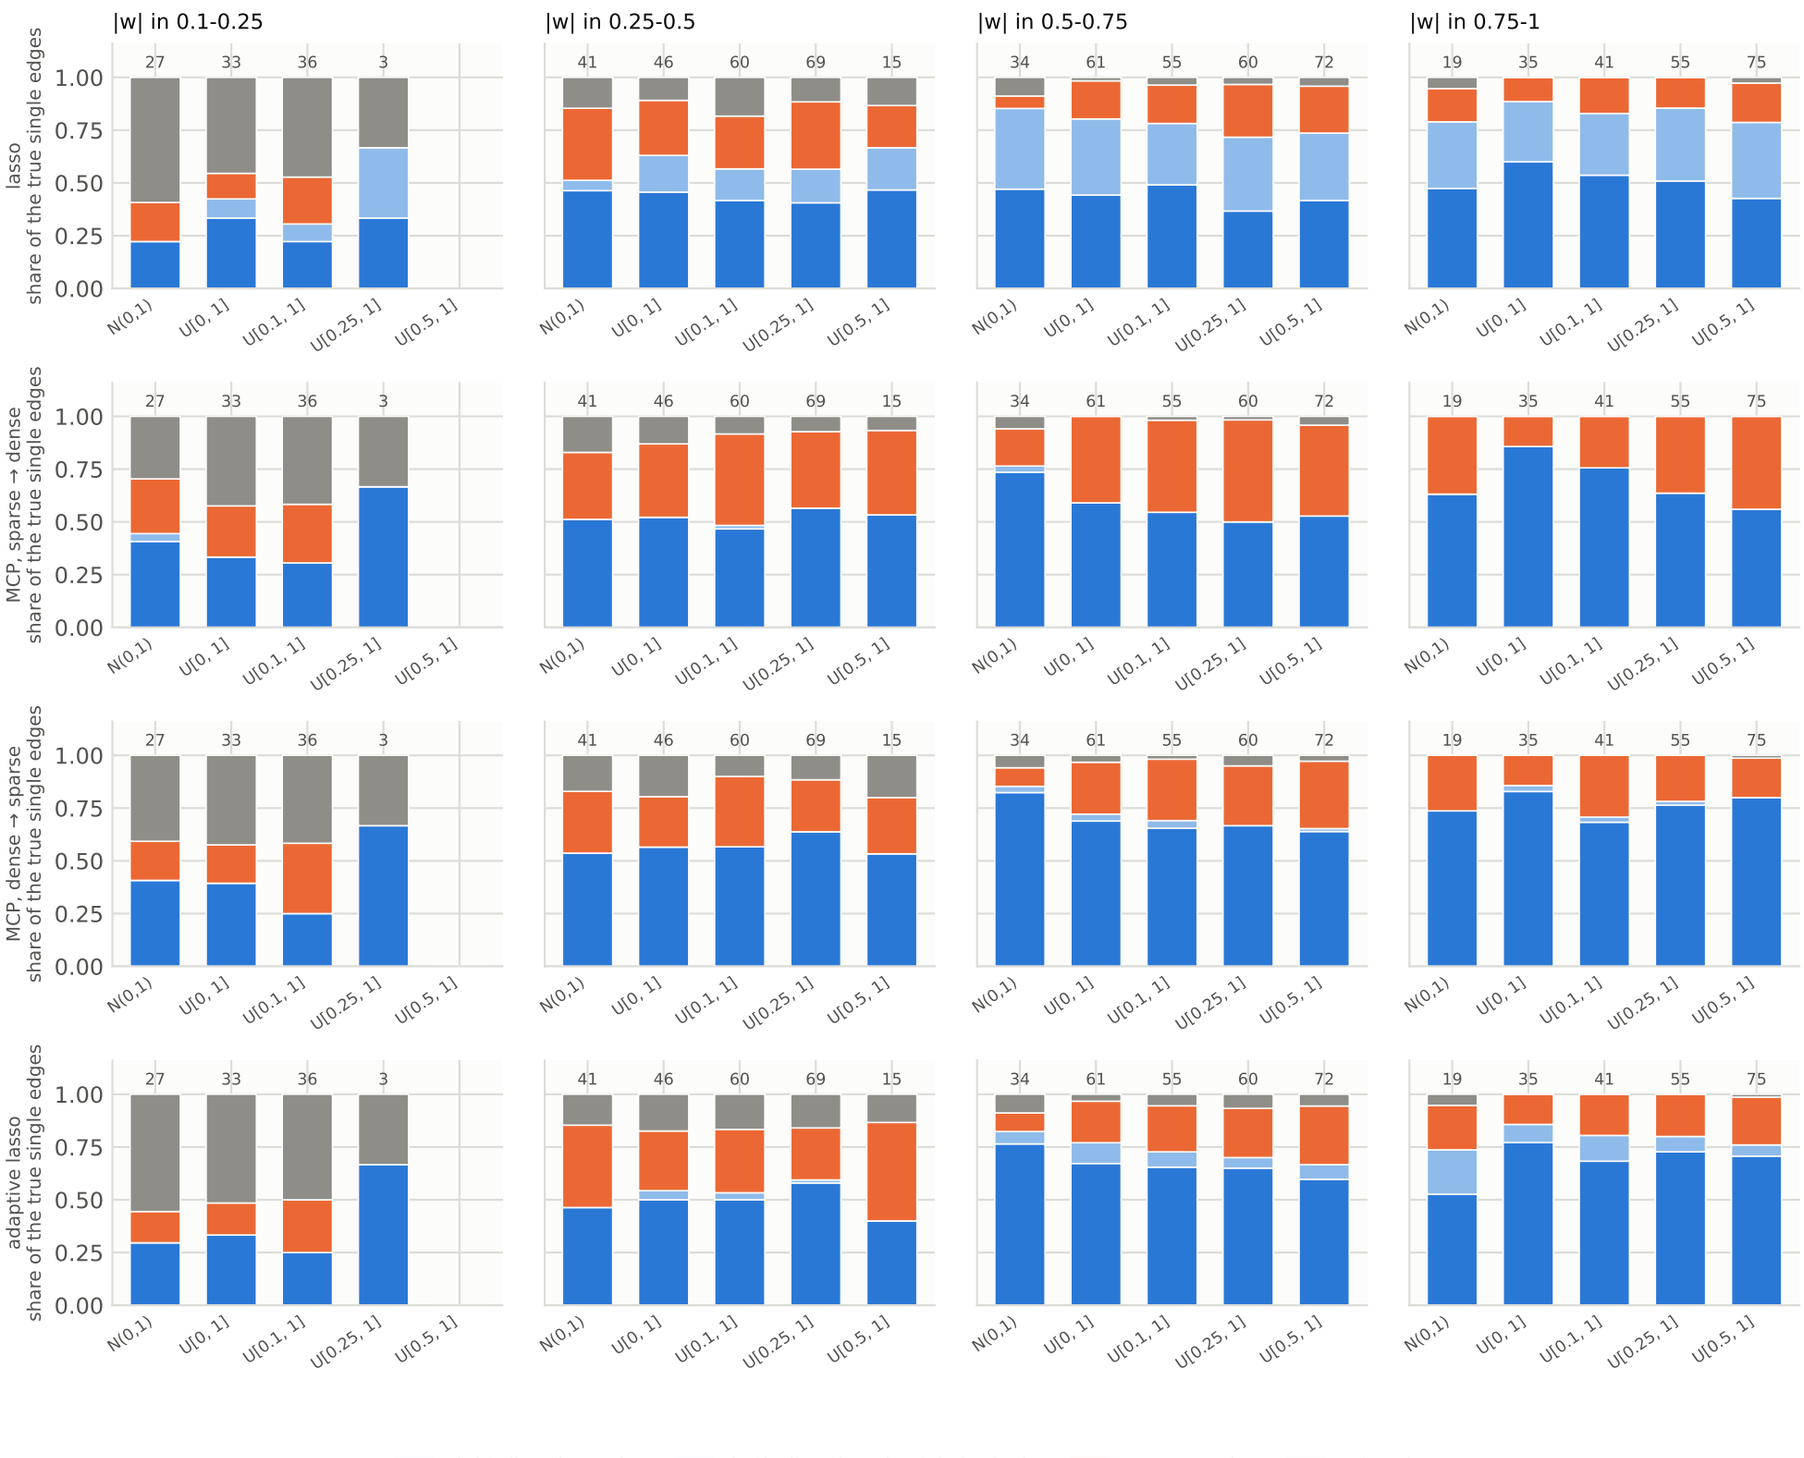
E3: the weight distribution as a knob, direct loss -- the same weight bin across the levels -- standardised |w|, the true single edges in the selected graph (BIC); p = 10, rescaled C, n = 10^4 (numbers: edges in the bin)
[laptop rehearsal: p = 10, true C = 2I, 4 replicates, 16 graphs per cell]



right direction only both directions kept (a hedge) reverse only missed

Graph per data set: the support that minimises loss + BIC penalty over the path (no truth used). Shares of the true single edges of the bin, pooled over all graphs of the cell; a level without edges in the bin leaves its slot empty.
