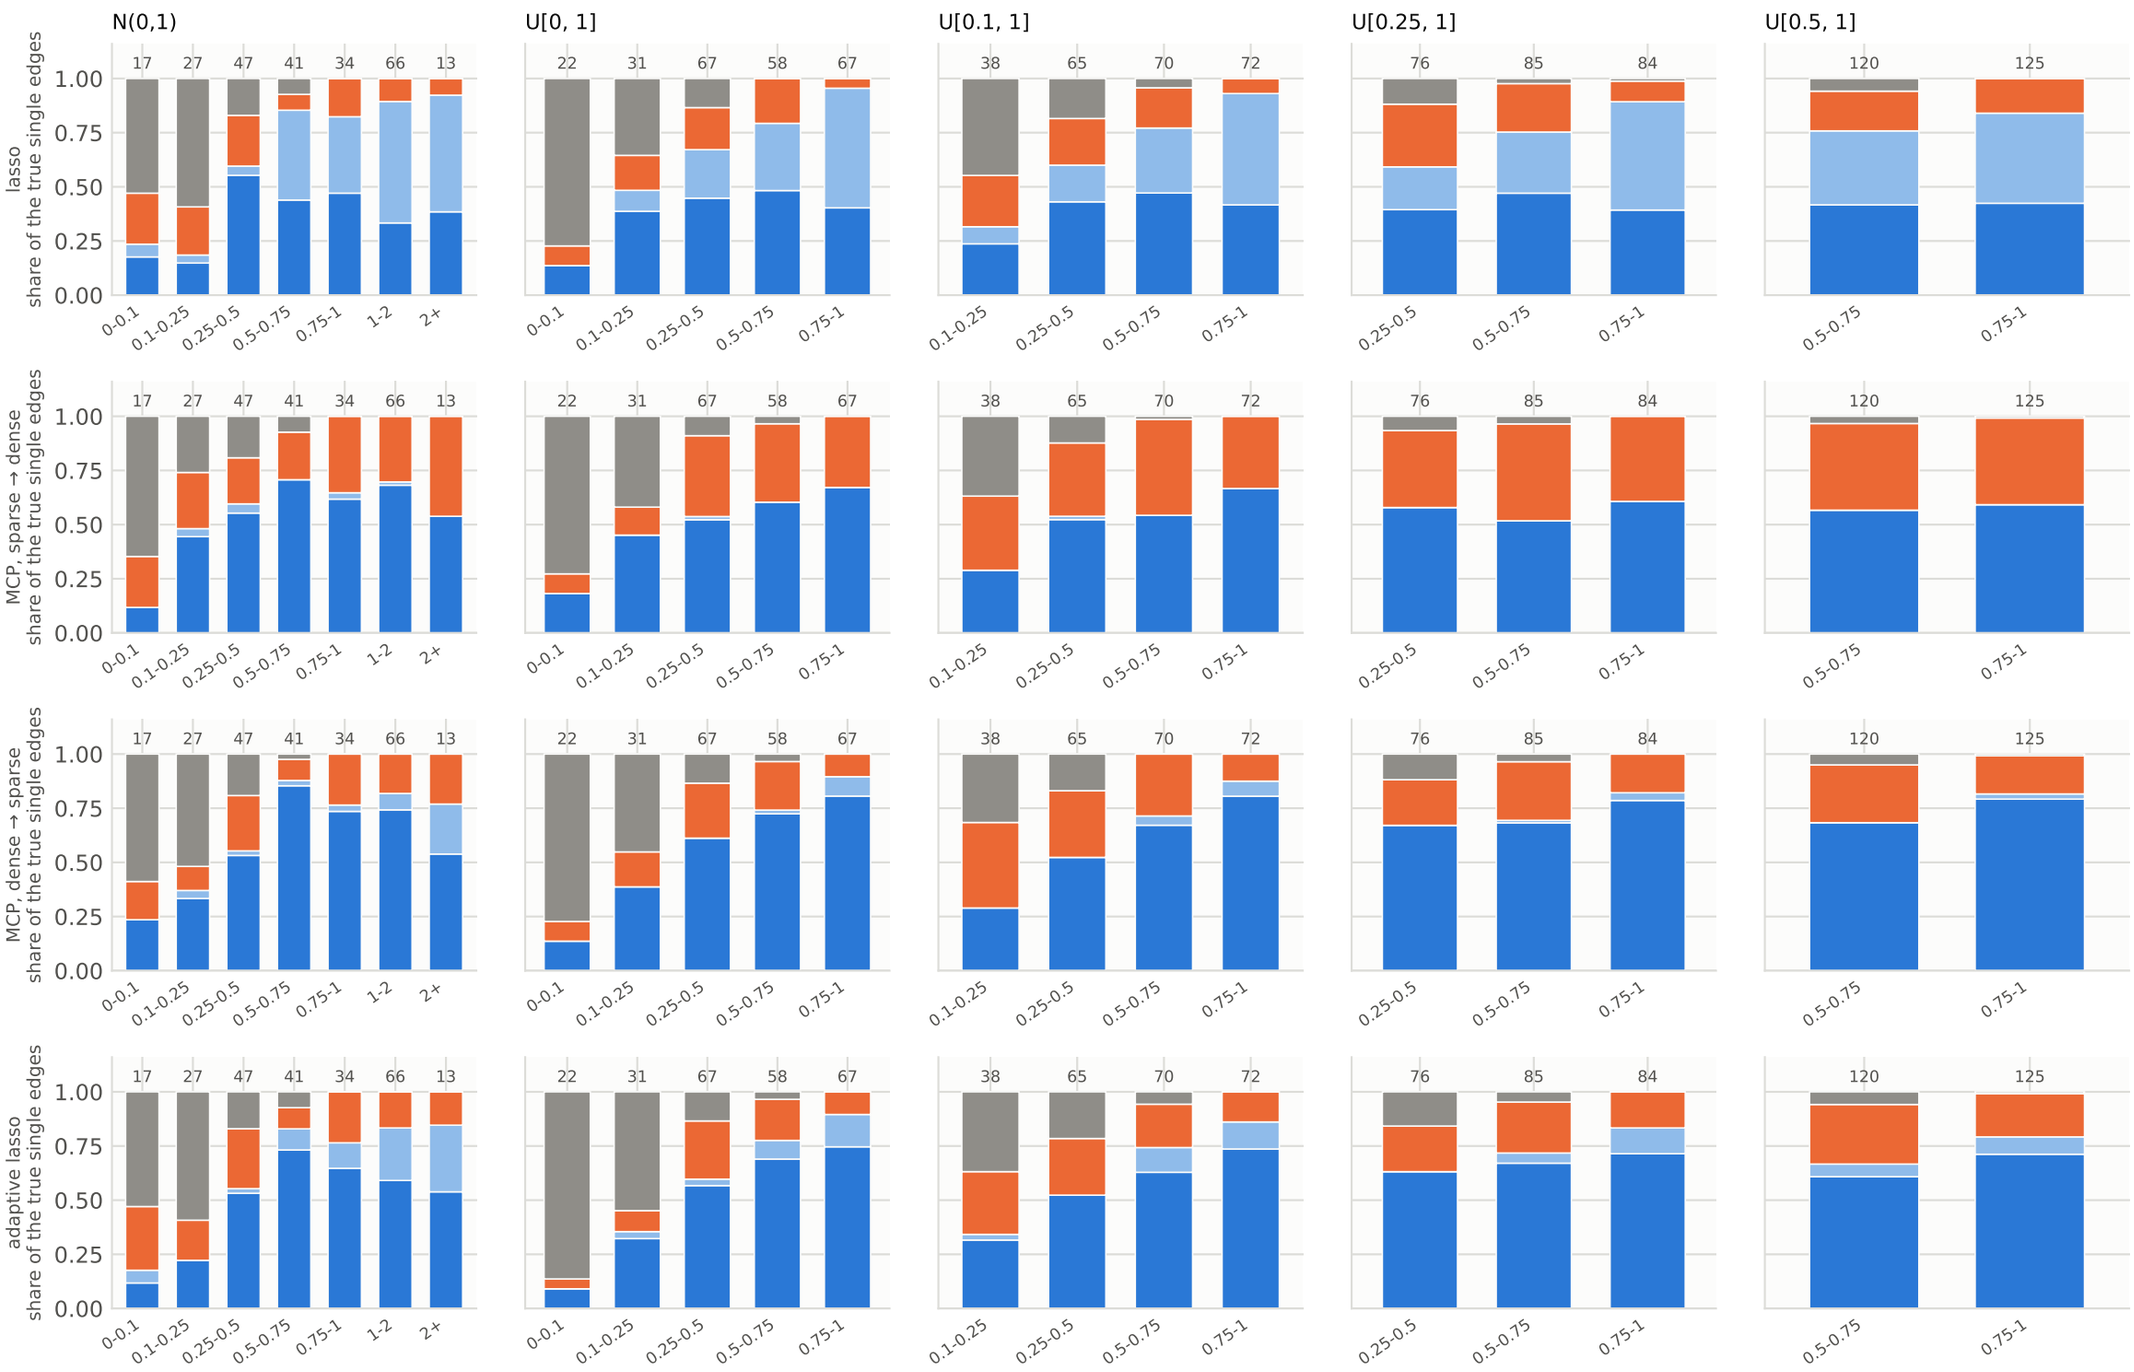
E3: the weight distribution as a knob, direct loss -- the true single edges in the selected graph (BIC) by weight within each level -- |w| on the generator's scale; p = 10, rescaled C, n = 10^4 (numbers: edges in the bin)
[laptop rehearsal: p = 10, true C = 2I, 4 replicates, 16 graphs per cell]



Graph per data set: the support that minimises loss + BIC penalty over the path (no truth used). Shares of the true single edges of the bin, pooled over all graphs of the cell (half-open bins on |w|); the number above a bar is the edge count behind it.
