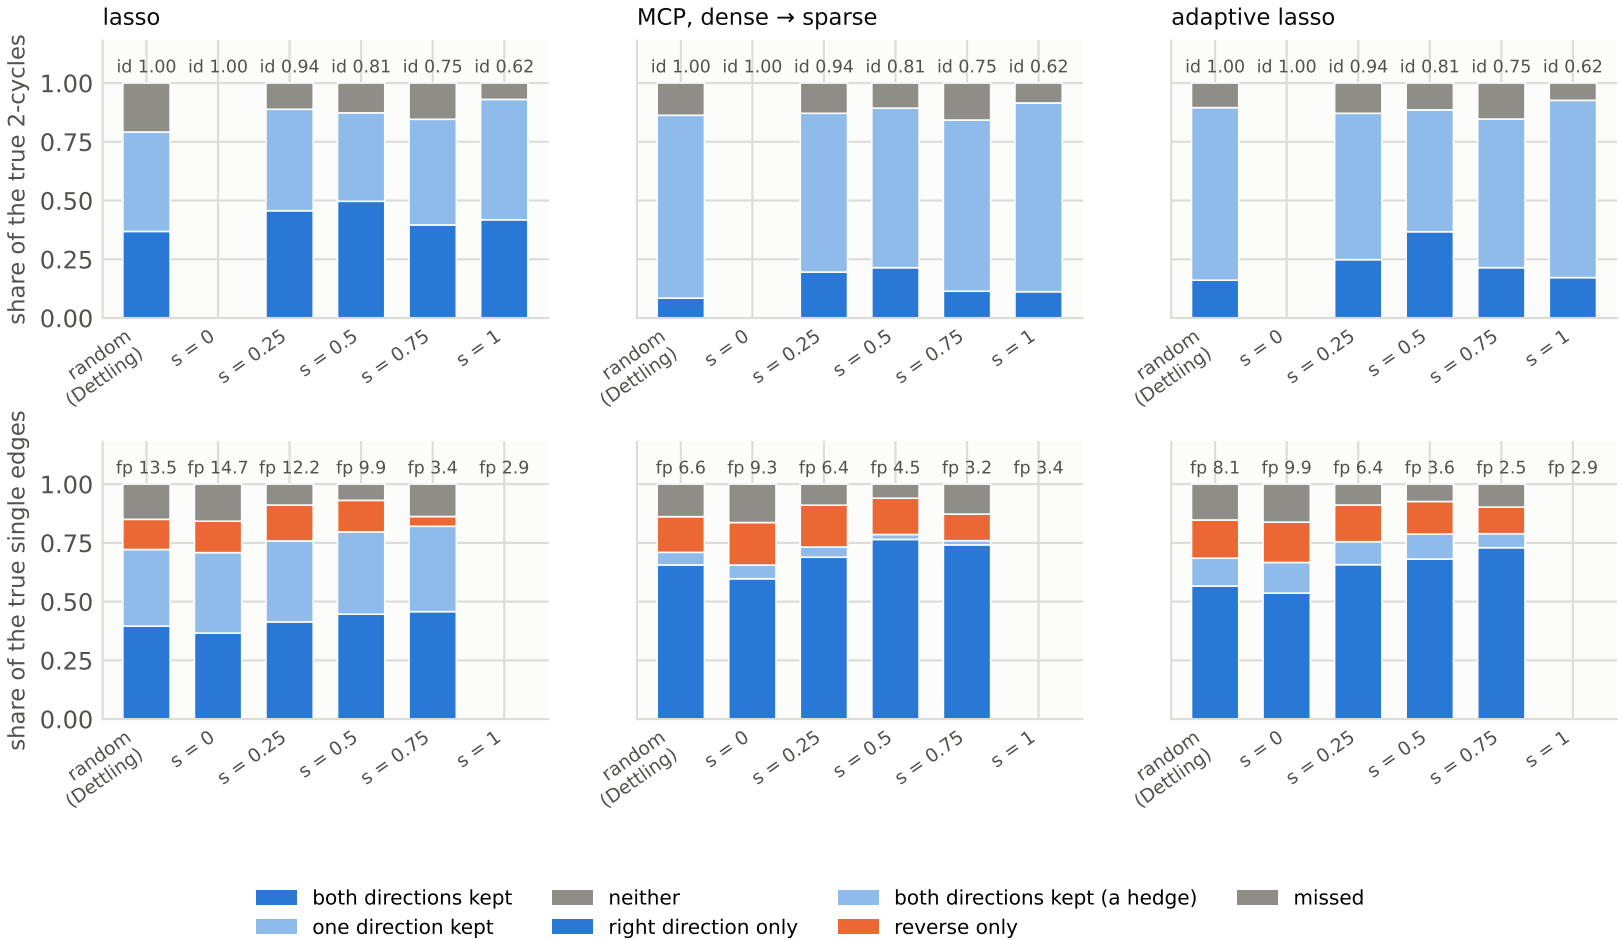
E5: the share of 2-cycles as a knob, direct loss -- the true 2-cycles (top) and the true single edges (bottom) in the selected graph (BIC); p = 10, rescaled C, n = 10^4
[laptop rehearsal: p = 10, true C = 2I, 4 replicates, 16 graphs per cell]



Graph per data set: the support that minimises loss + BIC penalty over the path (no truth used). Top: mean over the graphs with a 2-cycle of the share of their true 2-cycles kept with both directions / one / neither; id = the share of graphs whose truth is identified on its support. Bottom: the true single edges as in the orientation figure; fp = false positives per graph.
